

Liquid Fuel Filtration Skid

AFS offers a wide range of particulate and coalescing/separation filters and filter skids. Depending on the specification, these skids can serve as primary filtration for a liquid fuel process or provide continuous fuel polishing on a supply tank when fitted with pumps and controls.

These systems can form a primary part of the filtration system for a gas turbine or a combined fuel system serving a bank of critical-service backup generators.

Design features are based on customer specifications, with emphasis on AFS standard safety and operational features. Final flow, filtration performance, controls, and installation requirements are confirmed for the selected configuration.
